A feasibility study on the production of 99.5 wt% dimethyl ether (DME) is to be performed. The plant is capable of producing 50,000 metric tons of DME per year via the catalytic dehydration of methanol over an acid zeolite catalyst. The goal is to design a grass-roots facility, which safely and efficiently produces DME.

Dimethyl Ether Production Technology (DME) Technology overview 1. Background and process overview~ Dimethyl ether (DME) is a clean energy source and as it generates no sulfur oxide or soot during combustion its environmental impact is low.

### **4A4. Dimethyl Ether Production Technology (DME)**

Dimethyl Ether (DME) is a clean energy source that can be fabricated from natural gas, coal and biomass. DME creates definitely no SO<sub>x</sub> or ash when burned. It is gaseous at normal temperature and pressure, but changes to a liquid when subjected to moderate pressure or cooling. This easy liquefaction makes DME easy to transport and store.

Dimethyl ether (DME) is an organic chemical compound with the formula  $\text{CH}_3\text{OCH}_3$ . Fig. 6 shows two pathways for DME production: direct and indirect. DME can be produced indirectly by methanol synthesis at first step followed by the dehydration of two methanol molecules ( $2\text{CH}_3\text{OH} \rightarrow (\text{CH}_3)_2\text{O} + \text{H}_2\text{O}$ ) in the second step.
