Naive Bayesian Rough Sets University

Naive Bayesian Rough Sets 3 fact, uses a threshold of 0 on the difference between the a posteriori and the a priori probabilities, or a threshold of 1 on the likelihood ration; the rough Bayesian model uses a pair of arbitrary threshold values. However, the latter model does not address the problem of how to setting the threshold values.

A naive Bayesian classifier is a probabilistic classifier based on Bayesian decision theory with naive independence assumptions, which is often used for ranking or constructing a binary classifier. The theory of rough sets provides a ternary classification method by approximating a set into positive, negative and boundary regions based on an equivalence relation on the universe.

In this paper, we propose a naive Bayesian decision-theoretic rough set model, or simply a naive Bayesian rough set (NBRS) model, to integrate these two classification techniques.

TAN is a state-of-the-art extension of naive Bayes, that can express limited forms of inter-dependence among attributes. Rough sets theory provides tools for expressing inexact or partial dependencies within dataset. In this paper, we present a variant of TAN using rough sets theory and compare their tree classifier structures, which can

The elegant simplicity and apparent accuracy of naive Bayes (NB) even when the independence assumption is violated, fosters the on-going interest in the model. Rough Sets Theory has been used for different tasks in knowledge discovery and successfully applied in many real-life problems.

In case of huge data sets and the data with higher dimensional space, Naive Bayesian may face the problems that get most class labels with costly and that the current classifying rules can't adapt the varied data. So, an incremental Naive Bayes algorithm based in rough-set dynamic Reduct has been brought up. The algorithm is shown as following: attributes of conditional attributions has been dynamic reduced based on rough set to get the minimum attributes. Then naive Bayesian method with reduced ...

The Naïve Bayesian (NBayes) classification algorithm is based on a probabilistic model that incorporates strong (naïve) independence assumptions. It postulates that, given a response category $Y_k \in \{W, D, L\}$, a particular characteristic assumed by a covariate X_j is independent of any other feature.

Naive Bayesian - an overview | ScienceDirect Topics

Naive Bayesian classifier is widely used in machine learning because it is fast and easy to be implemented. Rennie et al. show that its performance is competitive with the state-of-the-art models like SVM while the latter has too many parameters to decide. Therefore, we choose the naive Bayesian classifier as the core of fine tuning.

Naive-Bayes is utilized to fuse uncertain information in order to classify the damage extent. 3.2.1. Attribute Reduction by Rough Set Theory. In practice, there is often a great deal of measurement data with a considerable number of attributes. Rough set theory is utilized to reduce redundant features and increase efficiency. In the RSNB method, the dynamic fingerprints of the suspected damage elements are represented in the form of a decision table .

This paper presents a semi-naive classifier named RoughTree, which is designed to alleviate the attribute interdependence problem of Naive Bayesian classifier. RoughTree uses the attribute dependence detecting measure in rough sets and splits the dataset into subspaces according to the selected attributes, which hold the maximum values by the attribute dependence measure.

Naive Bayesian classifier (NBC) is a simple and effective classification model, but its condition independence assumption is often violated in reality and makes it perform poorly. In our study, we attempt to improve the NBC model through the way of attribute selection based on rough set. The main idea of the improvement model is to select a closest approximate independent attributes subset and ...

By analyzing the classification principle and improvement of Bayesian and the Attribute Reduction of Rough Set, this paper proposed a Naive Bayes algorithm that the attribute order reduction and weighting were improved simultaneously. Experiment results demonstrated that the proposed method performed well in classification accuracy.

2 A probability experiment is an action through which specific results (counts, measurements or responses) are obtained. Probability Experiments Example: Rolling a die and observing the number that is rolled is a probability experiment. The result of a single trial in a probability experiment is the outcome. The set of all possible outcomes for an experiment is the sample space.
