In mathematics, a power of two is a number of the form  $2^n$  where  $n$  is an integer, that is, the result of exponentiation with number two as the base and integer  $n$  as the exponent. In a context where only integers are considered,  $n$  is restricted to non-negative values, so we have 1, 2, and 2 multiplied by itself a certain number of times.

By Miranda Sinclair. The powers of numbers are also called exponents. A number,  $X$ , to the power of 2 is also referred to as  $X$  squared. The number  $X$  to the power of 3 is called  $X$  cubed.  $X$  is called the base number. Calculating an exponent is as simple as multiplying the base number by itself.

Similarly, you can break up a single power of 2 into two powers which add up to the original power, such as  $2^9 (512) = 2^6 + 3 = 2^6 (64) \times 2^3 (8)$ . TECHNIQUE: We'll start with  $2^{15}$  as an example. Start by breaking up the given power of 2 into the largest multiple of 10 which is equal to or less than the given power, and multiply it by ...

Firstly, a reverse operation of powers would be the roots. If we take the same example of 2, being raised to the power of 2 which equals to 4, we can square-root 4 ( $\sqrt{4}$ ) and it equals to 2. Nevertheless, as mentioned earlier, a number can be raised to any power. Similarly, a root can have any coefficient, i.e. not only being square root.

Power of a number is obtained by multiplying it by itself. Where the base number ( $a$ ) is raised to the power limit ( $n$ ) which is equal to  $n$  times multiplication of  $a$ . For example,  $2 \times 2$  is stated as 'Two squared' or '2 to the 2nd power'  $2 \times 2 \times 2$  is stated as 'Two cubed' or '2 to the 3rd power'  $2 \times 2 \times 2 \times 2$  is stated as 'Two to the 4th power' or simply '2 to the 4th' and so on..<br> Use the below power of ...

When raising a power to a power in an exponential expression, you find the new power by multiplying the two powers together. For example, in the following expression,  $x$  to the power of 3 is being raised to the power

of 6, and so you would multiply 3 and 6 to find the new power.

In fact, the products form an ascending sequence of consecutive nonpositive powers of two. For the number 0.00390625, the sequence of products is  $2^{-7}, 2^{-6}, 2^{-5}, \dots, 2^{-1}, 2^0$ . Also, all the products, except the last, end with the digit 5; all negative powers of two in decimal form end in 5!

Another solution is to keep dividing the number by two, i.e, do  $n = n/2$  iteratively. In any iteration, if  $n\%2$  becomes non-zero and  $n$  is not 1 then  $n$  is not a power of 2. If  $n$  becomes 1 then it is a power of 2.

Finding the Power of a Quotient To simplify the power of a quotient of two expressions, we can use the power of a quotient rule which states that the power of a quotient of factors is the quotient of the powers of the factors. For example, look at the following example:  $(e^{-2f} 2)^7 = f^{14} e^{14}$   $(e^{-2} f^2)^7 = f^{14} e^{-14}$
