A is a buildup of electric charge in an object caused by the presence of many particles with the same charge. Ordinarily, the atoms that make up a material have a balance of protons and electrons. A material develops a static charge—or becomes charged—when it contains more of one type of charged particle than another.

KEY CONCEPT Materials can become electrically charged.

You can envision the force from an electric field by modeling its effects on a small, charged object—a test charge (q)—at some location. If there is an electrostatic force on the object, then there is an electric field at that point. Figure 2 illustrates a charged object with a net charge of q .
